Research Interest

I conduct research on efficient **machine learning (ML) systems** that translate **data** into **value** for decision making. The scope of my research spans across multiple subfields, from **scalable reinforcement learning systems** to **distributed state and data management systems**, as well as **code optimization** techniques. That is to answer the question **“how to co-design multiple layers of the software stack to improve the scalability, performance, and energy efficiency of ML systems”**. My long-term goal is to understand the fundamental connections between data/knowledge management and modern ML systems to make decision-making more transparent, robust and efficient.
